HEXON.INDU: FOR ADMINISTRATIVE HEADS OF FIELD UNITS

Attention: Foresters and Biologists.

From: T. G. Taylor and A. E. Boroll

Subject: Tree and Shrub Species Information

There is a recognized lack of information concerning soil and moisture requirements, relative erosion-control and secondary values of various indigenous and exotic species being planted in this region. Survival and evaluation studies on SCS plantings are expected to gradually furnish information regarding species adaptation to different soils and planting sites as well as soil preparation and care necessary for satisfactory growth. Further study of the wildlife value of the various plants is also essential to selection of species for planting purposes.

To this end we are transmitting to you what data we have been able to gather with the assistance of the Nursery and Soils Sections, regarding species of trees and shrubs which have been commonly planted in Region 8. Other species may be added as their use within the region increases. We are expecting that you will review frequently the material presented and make suggestions for changes and additions for which you have supporting data, so that we will finally have an authentic statement for field use.

T. G. Taylor,
Woodland Section.

A. E. Boroll,
Wildlife Section.
THE FOLLOWING LISTING OF SPECIES WITH SILVICAL DESCRIPTIONS IS SUBJECT TO REVISION AND CORRECTION. KINDLY TRANSMIT TO THE REGIONAL OFFICE ANY CORRECTIONS, ADDITIONS OR REVISIONS YOU FIND NECESSARY ON REVEGETATION FORM NO. 1
INDEX

Acor negundo
Lilanthus glandulosa
Caragana arborescens
Catalpa speciosa
Chilopsis linearis
Cornus stolonifera
Crataegus rivularis
Elaeagnus angustifolia
Fassugia paradoxa
Forosticra noo-mexicana
Fraxinus pennsylvanica lanceolata
Gleditsia triacanthos
Juglans major
Juglans nigra
Juniporus monospora
Maclura pomifora
Nelus alba
Lorus microphylla
Parryella filifolia
Parthenocissus quinqufolia
Picea engelmanii
Picea pungens
Pinus edulis
Populus alba
Populus angustifolia
Populus sargentii
Prunus americana
Punica granatum
Purshia tridentata
Rhus microphylla
Rhus trilobata
Robinia noo-mexicana
Robinia pseudoacacia
Rosa florida
Salix amygdaloides wrightii
Salix exigua
Salix gooddingii
Salix nigra
Scabucks coorulca
Symphoricarpus orbiculatus
Ulmus americana
Ulmus parvifolia
Ulmus pumila
Vitis labrusca
PLANT SPECIES INFORMATION FORM WOODLAND NO. 1

1. Name

Scientific
Common

2. Native country or locality and distribution

3. Habitat and associates

4. Size and form

5. Growth habit of roots - resistance to wind-throw

6. Growth requirements
   a. Moisture
   b. Soil
   c. Alkali (resistance)
   d. Elevation (limits)
   e. Temperature extremes
   f. Tolerance (shade)

7. Resistance to insects and disease

8. Seed production, collection, and propagation

9. Suggested erosion-control uses

10. a. Value of wood products
    b. Description of wood

11. Value for wildlife

12. Planting information

   Kind and age of planting material
   Time
   Special requirements and handling (transplanting)
   (use of wildings)

13. Miscellaneous

   a. Palatability
1. *Acor negundo* L. - Box elder

2. Canada and United States. Western Vermont, western Massachusetts and Connecticut, central New York, southwestern Ontario, and southward to west-central Florida, westward to Minnesota, Iowa, Nebraska, Missouri, eastern Kansas, Arkansas, eastern Oklahoma, western Louisiana and eastern and southern Texas. Var. interior Sarg. southern Manitoba, Saskatchewan and Alberta to Wyoming and through mountain regions of Colorado and Utah to New Mexico and Arizona; var. arizonicum Sarg. mountain canyons, central and southern Arizona up to 8000 feet altitude, and in Socorro County, New Mexico.

4. A tree, 50 to 70 feet high, with a large round head.

5. Roots penetrate to a depth of 5 to 10 feet, moderately windfirm.

6. a. Prefers moist sites but is moderately drought-resistant.

   b. On a variety of soils; calcareous soils, sandy loams, sands, and rich, deep humus soils.

   c. Moderately resistant to alkali. On calcareous and circumneutral soils.

   d. From sea level to 7500 feet above sea level.

   e. Temperature range from -30 degrees to 115 degrees F.

   f. Tolerant.

7. Not resistant to disease or insects. Short lived.

8. Seed matures in October. Amount and fertility dependent upon season. Cutting tests must always be made of this seed before collection. Best fertility is not high. Germination is poor, slow and very irregular. Seed should be planted in fall or winter.

9. In moist places as a soil binder and desilting agent.

10. a. Wood of low value for fuel, pulp, lumber.

    b. Light, soft, close-grained, not strong, creamy white.

11. Medium value for wildlife.

12. 1-0 rooted stock suitable for field planting. Easily handled.

   a. Palatability: cattle, low; sheep, low; rabbits, occasionally.

References - 1, 2, 3, 4, 5, 6, 9, 13, 16, 18, 22, 33, 40.
1. *Ilanthus glandulosa* Desf. (**Ilanthus altissima* (Miller) Swingle) — *Tree-of-Heaven*

3. China.

4. A medium sized tree, 30-60 feet tall, with a wide flat-topped crown.

6. a. Resists drought to an extreme.
   b. Indifferent to soil choice.
   c. Moderate resistance to alkali pH 6.0 to 8.0.
   d. From sea level to 6000 feet.
   e. Temperature ranges from 0 degrees to 125 degrees F. Does not stand extreme cold.
   f. Tolerant.

7. Resistant to disease and insects.

9. A soil binder in dry sites as well as moist sites.

10. a. Wood of low value.
    b. Soft, weak, coarse-grained, pale yellow, satiny.

11. No information; probably of little value except cover.

12. 1-0 rooted stock for field planting in spring. Spreads by suckers as well as seed. Rooted cuttings from female plants.

References - 1, 2, 9, 11, 16, 40.
1. *Caragana arbolescens* Lam. - Siberian Pea-Tree

4. A shrub or small tree to 20 feet, upright habit.

5. Windfirm. Roots penetrate to a depth of 5 to 10 feet.

   b. Sandy loam and clay loam soils, well-drained.
   c. Moderately alkali-resistant.
   d. From sea level to 7000 feet above sea level.
   e. Temperature range from -30 degrees to 120 degrees F.
   f. Intolerant ?

7. Resistant to disease and insects.

8. Fruit matures in July, moderate crops, fairly easily collected, fertility high. Seed germinates evenly two to three weeks after planting. Plants easily handled in nursery. Propagated by seeds, root cuttings or layers.

9. Valuable as a soil binder and in windbreaks.

10. No value as wood.

11. No information; probably good cover.

12. 1-0 rooted stock suitable for spring planting, easily handled.

13. a. Palatability: cattle, medium; sheep, medium; rabbits, medium.

References - 1, 2, 5, 6, 19, 20.
1. Catalpa speciosa Engelm. - Western Catalpa

2. United States, Illinois, through southern Indiana, western Kentucky and Tennesse, southeastern Missouri and northeastern Arkansas.

3. Borders of streams and ponds, and fertile, often inundated, bottomlands, associated with maple, elm, hickory, ash, oaks, etc.

4. A tree, occasionally 120 feet high, with a tall, straight trunk and slender branches forming a narrow round-topped head. Vigorous growth and relatively hardy.

5. Tap and lateral roots penetrating to a depth of 1 to 5 feet. Not windfirm.

6. a. Moist soils, well drained; requires 25 inches or more of rain. Stands some inundation. Somewhat drought-resistant.
   b. Deep, fertile, porous soils. Does not do well on heavy, poorly drained soils, or poor, sandy soil or stiff clay soils, or those with an impervious subsoil.
   c. Does not tolerate strong alkali. Neutral or acid soils best.
   d. pH 6.0 to 8.0.
   e. From sea level to 6000 feet above sea level.
   f. Temperature extremes -35 degrees to 120 degrees F.

7. Not resistant to disease or insects. Badly damaged by a soft heart-rot.

8. Fruit matures in August and September, crops are heavy, fertility good. Easily collected by hand. Germinates readily. Plants easily handled in the nursery. Sprouts readily.

9. A fair soil binder where cutting is not active.

10. a. High value as wood products, posts, poles, fuel and lumber.
    b. Light, soft, not strong, coarse-grained, light brown, durable.

11. Low values for wildlife.

12. 1-0 stock readily adapted to spring planting.

    a. Palatability: rabbits, high.

References - 1, 2, 3, 5, 9, 11, 13, 16, 22, 31, 40.
1. *Cornus stolonifera* Biech. - red-osier Dogwood

2. United States and Canada. Newfoundland and Labrador to Yukon Territory, California, New Mexico, Kansas, Virginia and southern Arizona.

4. A shrub 3 to 10 feet tall, thicket forming.

5. Widespread roots which prevent cutting by water.

6. a. Requires ample moisture supply.
   b. Moist, rich soils but will grow on sand dunes.
   c. Tolerates alkali in the presence of abundant water.
   d. Sea level to over 8500 feet above sea level.
   e. Temperature extremes from -50 degrees to 100 degrees F.
   f. Tolerant.

7. Resistant to disease and insects.

8. Seed matures about July, moderately easy to gather. Ten to twelve months stratification necessary for nursery production. Layers and cuttings may be used.

9. Valuable along living streams or on dunes that remain moist.

10. a. No value for wood.

11. Valuable as wildlife food and protection.

12. Probably 2-0 stock satisfactory for field use.

13. a. Palatability: cattle, medium; horses, medium; sheep, low.

References - 1, 2, 4, 14, 22.
1. Elaeagnus angustifolia L. - Russian Olive

3. Moist, rich soil in open sunlight, but does well under much less desirable circumstances. Does not grow naturally in the United States, although it may exist as escapes along ditches and water courses.

4. A small tree, usually under 30 foot, with an erect or commonly leaning or twisted and distorted trunk, producing an irregular tree. Forms dense thickets under favorable conditions.

5. Has a taproot and spreading laterals penetrating to a depth of 5 or 10 foot in the soil. Laterals are long and spreading. Resistant to windthrow.

6. a. Prefers considerable soil moisture, but will grow on drier sites and is moderately drought-resistant.
   b. Does best on moist, rich soils such as loams and clay loams, fair on sandy loams. Will grow on limestone soils.
   c. Moderately alkali-resistant - pH 6.0 to 8.0.
   d. Plantings from 500 foot or less to 3000 foot above sea level.
   e. Temperature range from -40 degrees to 110 degrees F.

7. Moderately resistant to insects and disease.

8. Fruit ripens in late summer and persists on the tree; crops are abundant and easily gathered by stripping. After-ripening period necessary. Three or four months stratification or plant in early winter. May be propagated from hardwood cuttings.

9. This plant is valuable for soil binding, desilting, wildlife food and general revegetation. Valuable in windbreaks or control of wind erosion.

10. a. Wood of little value although it may make fence posts and fuel.
    b. Wood dark brown, light, weak, coarse-grained, easily split and fairly durable in contact with the soil.

11. Provides excellent food and shelter for wildlife. Fruit eaten by many species of birds, including Gambel quail; available through most of winter.

12. 1-0 stock suitable for field planting in the spring.

13. a. Palatability: cattle, low; horses, low.

References - 1, 2, 5, 6, 11, 14, 16, 19, 20, 21, 40.
1. *Elaeagnus angustifolia* L. - Russian Olive

3. Moist, rich soil in open sunlight, but does well under much less desirable circumstances. Does not grow naturally in the United States, although it may exist as escapes along ditches and water courses.

4. A small tree, usually under 30 feet, with an erect or commonly leaning or twisted and distorted trunk, producing an irregular tree. Forms dense thickets under favorable conditions.

5. Has a taproot and spreading laterals penetrating to a depth of 5 or 10 feet in the soil. Laterals are long and spreading. Resistant to windthrow.

6. a. Prefers considerable soil moisture, but will grow on drier sites and is moderately drought-resistant.
   b. Does best on moist, rich soils such as loams and clay loams, fair on sandy loams. Will grow on limestone soils.
   c. Moderately alkali-resistant - pH 6.0 to 8.0.
   d. Plantings from 500 foot or less to 8000 foot above sea level.
   e. Temperature range from -40 degrees to 110 degrees F.

7. Moderately resistant to insects and disease.

9. This plant is valuable for soil binding, desilting, wildlife food and general revegetation. Valuable in windbreaks or control of wind erosion.

10. a. Wood of little value although it may make fence posts and fuel.
    b. Wood dark brown, light, weak, coarse-grained, easily split and fairly durable in contact with the soil.

11. Provides excellent food and shelter for wildlife. Fruit eaten by many species of birds, including Gambel quail; available through nest of winter.

12. 1-0 stock suitable for field planting in the spring.

13. a. Palatability: cattle, low; horses, low.

References - 1, 2, 5, 6, 11, 14, 16, 19, 20, 21, 40.
1. Fallugia paradoxa (D. Don.) Endl. - Apache Plume

2. United States. Western Texas and southern Colorado to southern Nevada, southeastern California south into Mexico.

3. Dry, rocky ridges, open canyons and sides of arroyos. Found in the Cevilla, artenisia and lower pinon belts, and at times passing through pinon-juniper belt to the ponderosa pine belt. Creosote bush, black brush, sagebrush, pinon, juniper, ponderosa pine, oaks, etc.

4. An upright shrub to 5 foot tall, diffusely branched.

5. Lateral and taprooted, penetrating to a depth of 4 to 5 foot or more and widespread.

   b. Grows on a wide variety of soils but does best on the deep, moist soils, well-drained. Common on sandy or clay loams.
   c. Neutral to alkaline soils, calcareous soils and moderately resistant to alkali.
   d. From 1000 feet to 8500 feet above sea level.
   e. Temperature extremes -20 degrees to 125 degrees F.
   f. Intolerant, prefers sunny places.

7. Moderately resistant to insects and disease.

8. Good ripens in July and is moderate to abundant, of fair to good fertility. Collection is easy because of abundance. Germination prompt, moderately easy to propagate in nursery.

9. A good erosion-control plant for soil binding and desilting.

10. No value to wood.

11. Furnishes some forage and shelter to wildlife.

12. 2-0 planting stock suitable for spring planting. 1-0 stock also used. Easily handled.

13. a. Palatability: cattle, medium; horses, medium; sheep, medium; rabbits, medium.

References - 2, 4, 14, 22, 40.
1. *Forostiaca neo-mexicana* A. Gray. - Wild Olive - *Olea*

2. United States. Western Texas to central Utah and southern California.

3. In canyons, along stream courses, parks, woodlands and in the semi-desert. Associated with creosote bush, sagebrush, pinon, juniper, oaks, etc.

4. A smooth shrub or small tree attaining 20 foot, with an irregular rounded top.

6. a. Drought-resistant but found in moist sites.
   b. Found on a variety of soils.
   c. Extremely resistant to moderate amounts of alkali. Calcareous soils and neutral soils.
   d. From 500 foot to 7000 foot or more above sea level.
   e. Temperature range from -20 degrees to 125 degrees F.
   f. Intolerant, usually found in thickets.

7. Resistant to disease and insects.

8. Fruit matures in August, crops are heavy, fertility is high. Seed collection difficult as drupes stick to bushes. Germination is prompt and plants easily handled in the nursery. May be propagated by layers or cuttings.

9. Useful for soil binding and desilting.

10. Wood of low value.

11. Furnishes food and good shelter for wildlife.

12. 1-0 rooted stock easily handled for spring planting. Cuttings may be used.

13. Spreads by layering.
   a. Palatability: cattle, low; horses, low; sheep, medium.

References - 1, 2, 4, 14, 22, 40.
1. *Fraxinus pennsylvanica lanceolata* (Borkhausen) Sarg. - Green Ash

2. United States. From Maine, Vermont, and southward to western Florida; westward to the eastern ranges of the Rocky Mountains, and into Utah and eastern and northern Arizona, and through Texas.

3. Low, moist ground, stream banks and uplands. Humid regions. Associated with elm, hackberry, sycamore, black cherry, red ash, and oaks.

4. A tree, rarely 60 feet high, with a rounded top.

5. Deep-seated fibrous roots which extend laterally, penetrate the soil to a depth of 5 to 10 feet. Windfirm.

6. a. Prefers a moist, well drained soil, but does grow on drier sites. Drought-resistant.
   b. Found on sandy loams and loams, but will grow on stiff clays of the uplands. Requires a fertile soil. Stunted on impenetrable hardpan soils.
   c. Marked resistance to alkali. Prefers a neutral or circumneutral soil.
   d. From sea level to 6000 feet.
   e. Temperate extremes -55 degrees to 110 degrees F.
   f. Intolerant.

8. Fruit matures in August, abundant crops, high fertility. Easily gathered by hand or shatter from tree. Seed should be planted in winter or soaked in water two or three days. Germination is very irregular.

9. As a filler and soil binder in moist places. Shelterbelts.

10. a. A valuable timber tree, durable wood.
    b. Heavy, hard, strong, coarse-grained, easy to split, light brown with thick greenish sapwood.

11. Fairly high wildlife values, especially food.

12. 1-0 rooted stock suitable for spring planting. Easily handled.

13. a. No palatability information.

References - 1, 2, 3, 5, 6, 9, 11, 13, 16, 18, 19, 20, 21, 22, 32, 40.
1. *Gleditsia triacanthos L.* - Honey Locust  
   a. *Gleditsia triacanthos inornis Willdenow* - Thornless Honey Locust  

2. United States. Southern Ontario westward to eastern Nebraska and Kansas, southward to Florida and Texas.  

3. Borders of streams and intervale lands, in moist fertile soil, usually growing singly or occasionally covering almost exclusively considerable areas; less common on dry, sterile, gravelly hills. Found in the humid regions with hickory, ash, boxelder, basswood and black walnut.  

4. A tree, 75 to 140 foot high, slender, spreading, somewhat pendulous branches forming a broad, open, rather flat-topped head.  

5. Deep rooted, penetrating the soil to a depth of 10 to 20 foot, wide-spread.  

6. a. Prefers ample soil moisture for best growth, but is also quite drought-resistant.  
   b. Found on a variety of soils but does best on deep, fertile, humus soils. Does poorly on gravelly or heavy clay soils and fails on shallow soils. Lime is favorable to growth. pH 6.9 to 7.2 best, or pH 6.0 to 8.0.  
   c. Prefers a neutral to acid soil, but will grow on soils containing considerable quantities of lime and alkali. Moderately resistant to alkali providing the water supply is ample.  
   d. Found from sea level to 5000 feet above sea level.  
   e. Temperature extremes -30 degrees to 110 degrees F.  
   f. Very intolerant.  

7. Moderately resistant to insects and disease. Twig girdler.  

8. Seed matures in the autumn, is fairly abundant and moderately easy to collect. Seed delayed in germination. Most practical way to secure germination of this hard-coated seed, in nursery, is to treat with Conc. H₂SO₄ (sulphuric acid) for approximately one hour.  

9. Not too valuable for erosion control, but is useful in windbreaks.  

10. a. Valuable for fence posts, rails and lumber.  
    b. Wood hard, strong, coarse-grained, very durable in contact with the soil, rod to bright red-brown.  

11. Slight value to wildlife as food and cover.  

12. 1-0 rooted stock suitable for planting in the field in the spring. Needs care and cultivation.  

13. a. Palatability: cattle, medium; horses, medium; sheep, medium; rabbits, high.  

References - 1, 2, 3, 5, 6, 9, 11, 13, 16, 19, 20, 21, 22, 26, 27, 40.
1. *Juglans major* **Holz**
   
   *Juglans rupéstris major* Torrey

2. United States. Texas, central and southern New Mexico and Arizona.

3. Banks of streams and in canyons. Covillea to ponderosa pine bolt associated with sycamore, cottonwood, willows, mulberry, ash and oaks.

4. A tree, sometimes 50 feet high, single stem or a clump of stems forming a narrow head.

6. a. Requires an abundance of moisture.
   
   b. Rough, rocky soils to deep, rich soils. Indifferent to quality.

   c. Moderately alkali-resistant.

   d. Ranges 1400 to 7000 feet above sea level.

   e. Temperature range from -30 degrees to 120 degrees F.

   f. Very intolerant.

7. Moderately resistant to disease and insects. Subject to heart rot and damaged in some localities by a witch broom organism. Sometimes defoliated by caterpillars.

9. Cover plant in moist canyons.

10. a. Used some for fuel and posts. Sound material has relatively high value, but present value low due to small amounts available.

    b. Hard, heavy, strong, coarse-grained, deep chocolate-brown heartwood.

11. Moderate value to wildlife as food and cover.

12. 1-0 rooted stock for spring planting. Easily handled.

   a. Palatability: cattle, low; horses, low; sheep, medium; rabbits, medium.

References - 1, 2, 12, 13, 22, 40.
1. *Juglans nigra* L. – Black Walnut

2. United States and Canada. Western Massachusetts to southern Ontario, southern Michigan, southeastern Minnesota, central and northern Nebraska, central Kansas, eastern Oklahoma, southward to western Florida, central Alabama, Mississippi, Louisiana and Texas.

3. Rich bottoms and fertile hillsides. Humid regions. Ash, hackberry, basswood, elm, oaks, etc.

4. A tree, frequently 100 feet high, thick limbs spreading gradually and forming a comparatively narrow, shapely, round-topped head.

5. Long taproots penetrating to a depth of 10 to 15 feet. In Nebraska to a depth of 5 feet or more. Not windfirm.

6. a. Moist sites, porous subsoil, not too wet. Somewhat drought-resistant.
   c. Not resistant to moderate alkali unless water is present. pH 7.3 to 8.0. Acid soils not favorable.
   d. From sea level to 5000 feet above sea level.
   e. Temperature range from -30 degrees to 115 degrees F. Damage from late spring frost is greater on the poorer soils.
   f. Intolerant. During the first years it will bear considerable shading from the side.

7. Moderate resistance to disease or insects.

8. Fruit matures in fall, abundant crops, high fertility. Collection easy by beating down the nuts. Germinates evenly after 3 to 4 weeks from time of planting. Easily handled in the nursery. Seed should be protected from rodents from time of planting to completion of germination period.

9. A soil binder and provides protection from blowing. Useful only in moist places.

10. a. Value of wood high. Lumber, posts and special uses.
    b. Heavy, hard, strong, rather coarse-grained, very durable, rich, dark brown heartwood.

11. Value to wildlife for food, mainly squirrels.

12. 2-0 or 2-1 rooted stock for spring planting. Easily handled. Broken or torn roots should be carefully pruned with a sharp knife so as to make a clean, smooth wound which will heal readily.

13. Nuts of high value for food. Walnut is toxic to other tree and shrub growth and usually only grass is found directly underneath the crown where the roots are spread.
   a. No palatability information.
1. *Juniperus monosperma* Sarg. - One-seed Juniper

2. United States and Mexico. East base of the Rocky Mountains from Wyoming, Colorado, western Oklahoma, western Texas, New Mexico, Arizona, Utah and into Mexico.

3. Desert plains and mountains. Pinon belt associated with other juniper, ponderosa pine, oaks, etc.

4. A tree, occasionally 40 to 50 feet high, short, stout branches forming an open, very irregular head. More often a much branched shrub, sometimes only a few feet high.

5. Taprooted, windfirm.

   b. Dry, rocky, or gravelly soils.
   d. 3500 to 8000 feet elevation above sea level.
   e. From -30 degrees to 110 degrees F.
   f. Tolerant in youth to intolerant in age.

7. Resistant to disease and insects. Some borer damage in old trees.

8. Fruit matures October, crops usually heavy, fertility fair to good. Easily collected and cleaned. Seed usually stratified for 3 weeks. Germination usually even after 3 or 4 weeks.

9. Valuable as a watershed cover and soil binder.

10. a. Wood of high value for fuel, posts, poles.
    b. Heavy, slightly fragrant, light reddish brown.

11. High value as food and good shelter for wildlife.

12. 1-1 stock suitable for spring planting. Easily handled.

13. a. Palatability: cattle, low; sheep, low.

References - 1, 13, 7, 21, 22, 40.
1. *exaspera pomiforme* Sch. - Osage-Orange 
   (*Tecjylon pomiforme* Rafn.)

2. United States. Southern Arkansas to southern Oklahoma and southward in Texas.

4. A tree, sometimes 50 to 60 feet tall with a short trunk, and stout, erect, ultimately spreading branches forming a handsome, open, irregular, round-topped head.

5. Combination of tap and lateral roots, wide-spread and penetrating to depths of 4 to 5 feet or in fine textured soils to a depth of 10 to 20 feet. *Windfirm*.

6. a. Prefers ample soil moisture but is able to stand extreme aridity.
   b. Rich, fertile alluvials or slopes preferred, but will grow on most any soil.
   c. Prefers neutral and slightly acid soils, but will grow in moderate alkali.
   d. From 500 to 6000 feet above sea level.
   e. Temperature extremes from -30 to 120 degrees F.
   f. Tolerant.

7. Resistant to insects and disease.

8. Fruit ripens in the fall, crops are heavy and seed fertility is high. Collection by hand is easy. Seed difficult to extract from fruit. Germination is fairly prompt and plants are easily handled in the nursery. May be propagated from root-cuttings and young wood-cuttings. Suckers readily.

10. a. High value to wood products, posts, ties, and wheel-stock.
    b. Wood heavy, exceedingly hard, very strong, flexible, coarse-grained, very durable, bright orange turning brown on exposure.

11. Provides excellent shelter and some food for wildlife.

12. 1-0 stock suitable for field planting. Not readily secured from cuttings in the field. Suckers readily. Spring planting.

13. An excellent hedge and windbreak plant.
    a. Palatability: rabbits, low.

References - 1, 2, 3, 9, 11, 13, 5, 16, 22, 25, 40.
1. *LorUs alba* L.  
   a. *LorUs alba* tartarica  
      Russian *Mulberry*

4. Low, bushy tree, 30 to 40 feet tall, with a low, broad, rounded crown. Dense growth.

5. Tap and lateral roots spreading widely throughout the soil and to a depth of 10 to 20 feet. Windfirm.

    b. Best on rich loams but grows on sands and clays, not exacting.  
    c. pH 8.1 to 8.4. Moderately alkali-resistant.  
    d. Sea level to 7500 feet above sea level.  
    e. Temperature range 0 degrees to 100 degrees F. Cannot endure severe winters.  
    f. Tolerant of shade.

7. Comparatively free of insect attack and disease.

8. Fruit ripens in June, crops are heavy, fertility good. Easily collected but difficult to separate the seeds from the pulp. Germination prompt, plants easily handled in nursery. Cutting may be used but is not entirely satisfactory.

10. a. Wood of low value, used for fuel and posts.  
     b. Wood heavy, elastic, moderately strong, and coarse-grained.

11. Valuable as food for wildlife, provides some shelter.

12. 2-0 stock suitable for field planting in spring. Cuttings may be used but are not as satisfactory.

13. Shade, and food. Many varieties. A trashy or mossy tree in cities and about houses.  
   a. Palatability: cattle, high; horses, medium; sheep, medium.

   *LorUs alba* tartarica the most hardy.

References - 1, 2, 9, 5, 16, 19, 22, 30, 40.
1. *Horus microphylla* Buckl. - *Mexican Mulberry*  
(*Horus coltidifolia* H.B.K.)

2. United States and Mexico. Western Texas, southern New Mexico and southern and central Arizona.

3. Dry limestone hills, mountain canyons, and mountain sides. Covilloa and pinon belt associated with oaks, pinon and juniper.

4. A tree, sometimes 15 to 20 foot high; spreading, rounded top.

6. a. Extremely drought-resistant.  
b. Rocky, sandy soils, rather indifferent.  
d. 1000 to 6000 foot elevation above sea level.  
e. From -10 degrees to 120 degrees F.  
f. Intolerant.

7. Resistant to disease and insects.

8. Fruit matures in August, crops moderately abundant, easily collected on canvas, but available only short time due to birds. Fertility fair. Nursery production good.

9. A fair soil binder on dry sites.

10. a. No value to wood.  
b. Heavy, hard, close-grained, dark orange color.

11. High value as food and shelter to wildlife.

12. 1-0 rooted stock easily handled for spring planting.

13. a. Palatability: cattle, high; rabbits, high.

References - 13, 22, 40.
1. *Parryella filifolia* Torr. & Gray -

2. Western United States.

3. Dry hillsides and mesas, sand dunes. *Artemisia* and pinon belts; pinon, juniper, *Atriplex*, etc.

4. Small shrub 2 to 6 feet high.

5. Fine, fibrous roots, windfirm.

6. a. Extremely drought-resistant.  
   b. Sandy soils.  
   c. Moderately alkali-resistant.  
   d. 2000 to 7000 feet above sea level.  
   e. From -30 degrees to 130 degrees F.  
   f. Intolerant.

8. Heavy seed production, matures in August and September, easily collected, fertility high. Readily handled in the nursery. Germinates evenly after one week.

9. Soil and sand binder on dry sites.

10. a. No value to wood.

11. Some value to wildlife as food and shelter.

12. 2-0 rooted stock for field planting in the spring. Easily handled.

13. a. Unpalatable to livestock.

References - 22 and 40.
1. *Parthenocissus quinquefolia* Planch. - *Virginia Creeper*  
(*Amelopsis quinquefolia* Michx.)  
(*Psedora quinquefolia* (L.) Greene).

3. Moist places along streams and in woods, associated with oaks, maples, elms, etc.

4. A high climbing bush or vine.

5. No information.

6. a. Requires good moisture conditions.
   b. Deep, rich soils, will grow on other soils.
   d. Sea level to 8000 feet above sea level.
   e. Temperatures -30 degrees to 120 degrees F.
   f. Intolerant.

7. Resistant to disease and insects.

8. Heavy crops of fruit in August to December, easily gathered, high fertility. Germination high, easily grown from seed in nursery. Propagated from cuttings.

9. A soil binder in moist places. Covers the ground rapidly and thoroughly.

10. a. No value to wood.

11. Valuable as food and shelter to wildlife.

12. Easily planted in the field as 1-0 or 2-0, rooted stock, 2-0 stock probably most desirable.

13. a. No palatability information.

References - 1, 2, 14, 22.
1. **Picea engelmannii** Engelm. - Engelmann Spruce

4. A tree, sometimes 120 feet tall, with spreading branches producing a narrow, compact, pyramidal head.

5. Lateral roots penetrating to shallow depths, not windfirm.

6. a. Dry to wet sites, but does poorly on porous soils.
b. Retentive, fine loams, deep, rich, alluvial soils, occasionally on residual soils.
d. From 5000 to 12,000 feet above sea level.
e. Temperature range from -40 degrees to 100 degrees F.
f. Very tolerant.

7. Moderate resistance to disease and insects.

8. Cones mature in August, fairly abundant, moderately fertile seed. Moderately difficult to collect. Seed germinates evenly in three weeks' time. Seed bed treatment required to control damping off. Shade during first year and part of second.

9. Most valuable as a watershed cover.

10. a. Used for poles, posts, fuel, lumber.
b. Light, soft, not strong, close-grained, pale yellow tinged with red.

11. Valuable as food and good cover for wildlife.

12. 2-2 rooted stock for spring planting. Easily handled in the field.

13. a. No palatability information.

References - 1, 6, 10, 13, 15, 35.
1. *Pinus pungens* Engelm - Colorado Spruce

2. United States. Colorado and eastern Utah, southern and northwestern Wyoming, and southward into northern New Mexico.

4. A tree, usually 80 to 100 feet tall, pyramidal crown becoming thin and ragged in age.

6. a. Prefers abundant supply of moisture, but will grow on drier sites.
b. Moist, rich, gravelly, sandy or rocky soils.
c. Not resistant to alkali, acid to neutral soils pH 6.0 - 7.0. Sub-acid soils.
d. From 6000 to 11,000 feet above sea level.
e. Temperature range -40 degrees to 100 degrees F.
f. Tolerant.

7. Moderate resistance to disease and insects.

8. Cones mature in August, moderate abundance, moderately difficult to collect. Seed germinates evenly in 3 weeks time. Seed bed treatment to control damping off. Shade during first year and part of second. Winter protection.

9. Not of great value in erosion control other than watershed protection or use in windbreaks because of moisture requirement.

10. a. Poles, posts and lumber.
b. Light, soft, close-grained, weak, pale brown or nearly white.

11. Of value as food and good shelter for wildlife.

12. 2-2 rooted stock for spring planting. Do not prune the tops.

References - 1, 2, 10, 13, 14, 15, 20, 21, 34.
(Pinus combridoes odulis. Voss.)

2. United States and Mexico. Northern Colorado, to extreme western Oklahoma, western Texas, westward to eastern Utah, southwestern Wyoming, northern and central Arizona, into northern Mexico.

4. A tree often 40 to 50 feet high with short, erect branches forming a narrow head, frequently divided with a low, round-topped head.

5. Wide-spreading laterals and taproots, penetrating the soil shallowly. Moderately windfirm but less than most pines. Tap 1½ to 2 feet long. Laterals spread 5 to 15 feet.

   b. Deep, well drained, gravelly sands or loams, also on shallow, rocky soils, on fine grained adobe.
   c. Moderate resistance to alkali. Soil neutral or alkaline. Calcareous,
   d. From 4000 feet to 9000 feet above sea level.
   e. Temperature range from -30 degrees to 120 degrees F.
   f. Very intolerant.

7. Moderate resistance to insects and disease.

8. Cones mature in September and October, crops abundant every few years, easily collected on canvas, fertility moderate. Germinates promptly, plants easily handled in nursery.

9. Of value in erosion control mainly as watershed cover. Prevents soil blowing when established.

10. a. Wood products of fair value for fuel, posts and poles.
    b. Light, soft, not strong, brittle, pale brown.

11. High value to wildlife for food and shelter.

12. 1-1 rooted stock, spring planting. Easily handled.

13. Nuts used as food.
    a. No palatability information.

References - 1, 14, 13, 15, 8, 39, 40.
1. *Populus alba* L. - White Poplar

3. Europe and Asia.

4. A tree, 50 to 60 feet tall, forming a large, spreading, rounded or irregular crown of large crooked branches.

5. Shallow lateral roots, moderately windfirm.

6. a. Prefers a constant abundant moisture supply but will grow on drier sites.
   b. Rich, moist alluvial soils best but will grow on nearly any soil.
   c. Moderate resistance to alkali.
   d. Found from sea level to 8000 feet above sea level.
   e. Temperature range -40 degrees to 130 degrees F.
   f. Very intolerant.

7. Moderate resistance to insects and disease.

9. Soil binder where cutting is not active. Temporary windbreaks.

    b. Light, soft, weak, difficult to split, reddish yellow heartwood.

11. Low value to wildlife.

12. 1-0 rooted stock or hardwood cuttings for spring planting in the field, easily handled.

13. Use male trees. A number of varieties.
   a. Palatability: cattle, medium; sheep, medium; rabbits, medium.

References - 1, 2, 11, 9, 19, 40.
1. *Populus angustifolia* James. - Narrow-leaved Cottonwood

3. Banks of streams or on moist flats. Covillea upward to the spruce-aspen belt. Willows, alders, alpine fir, engelmann spruce, blue spruce, etc.

4. A tree, 50 to 60 feet high, with slender erect branches forming a narrow and usually pyramidal head.

6. a. Requires an ample water supply.
   c. Moderately resistant to alkali when water is abundant. pH 6.9 - 7.2.
   d. At 5000 to 10,000 feet above sea level.
   e. Temperature range -35 degrees to 100 degrees F.
   f. Intolerant.

7. Moderate to poor resistance against insects and disease.

8. Fruit ripens in May, abundant crops, medium fertility. Easily collected by hand from ground, plants adaptable to nursery production. Cuttings most economical.

9. Soil binding and desilting where cutting is not active.

10. a. Wood of high value locally, fuel, posts and lumber.
    b. Light brown, soft, weak, thick sapwood.

11. Low wildlife values.

12. 1-0 rooted stock or rooted cutting for spring planting. Hardwood cutting most economical.

13. Especially subject to damage when small or until out of reach of livestock.
   a. Palatability: cattle, low; horses, low; sheep, low.

References - 1, 2, 5, 12, 13, 14, 15, 40.
1. *Populus sargentii* Dodge - Cottonwood

2. United States. Foothill region of the Rocky Mountains from Saskatchewan to New Mexico, and ranging east to the Dakotas, western Nebraska, Kansas, Oklahoma and Texas.

4. A tree 60 to 90 foot tall, with erect and spreading branches forming a broad, open head.

5. Root system of shallow laterals, not particularly windfirm. Penetrates to a depth of 1 to 5 foot.

6. a. Requires ample moisture supply.
   b. Rich soils of the bottoms.
   c. Moderately resistant to alkali in the presence of ample water.
   d. Ranges from 2000 to 9000 foot above sea level.
   e. Temperature extremes -30 degrees to 110 degrees F.
   f. Very intolerant.

7. Does not resist insects or disease.

8. Seed matures in May, crop abundant, fertility high. Easily collected, germination high if planted the same season. Plants easily handled in the nursery. Most satisfactorily secured from cuttings.

9. Suitable as a filler on bars and stream banks. Inferior to willows where active cutting by water is present.

10. a. Valuable locally for fuel, posts and lumber.
    b. Dark yellowish brown heartwood; thick sapwood is nearly white.

11. Furnishes some food and cover for wildlife.

12. 1-0 rooted stock, or 1-0 rooted cuttings for winter or spring plants. Hardwood cuttings are satisfactory for field planting and are more economical. Pulled wildlings are suitable for field use.

13. a. Palatability: cattle, medium; horses, medium; sheep, low; rabbits, low.

References - 1, 2, 5, 11, 12, 13, 15, 19, 20.
1. **Prunus americana** var. *marsh* - Wild plum

2. United States. In the Rocky Mountain region along the eastern foothills of Colorado to northern New Mexico, northeastern Utah, and elsewhere in the United States.

3. Moist bottomlands, dry uplands, low mountain slopes, and moist sites of foothills and mountains. Associates numerous because of range and distribution.

4. A shrub or tree from 3 to 6 feet high or 20 to 35 feet in height, with many spreading branches forming a broad, graceful head. In the Rocky Mountain region it is found as low thickets.

5. Wide-spreading lateral roots and taproot to a depth of 3 to 4 feet. Wind firm.

6. a. Requires considerable soil moisture throughout the year.
   b. Rich, moist soils best, although it will grow in drier, sandy loams.
   c. Not resistant to alkali. Prefers a neutral to acid soil, pH 6.0 to 8.0.
   d. Sea level to 8000 feet or possibly higher.
   e. Temperatures range from -30 degrees to 115 degrees F.

7. Moderately resistant to disease and insects.

8. Seed production heavy, fertility good, easy to gather. Four to five months stratification or plant in early fall for nursery production. Fruit ripe in July to September.

9. Thicket forming habit in this region, together with aggressiveness on the proper sites, makes it useful as a sand binder. Spreads by means of root sprouts. Effective for wind erosion control.

10. a. Wood is of little value.
    b. Heavy, hard, close-grained, strong, dark rich brown tinged with red.

11. Provides food and shelter for wildlife. Fruit eaten by many kinds of birds, and by humans.

12. 1-0 stock for field planting; do not plant with crowding species in this region nor plant too closely. Spring planting. Difficulty in securing sufficient roots when lifted in the nursery.

   a. Palatability: cattle, low; horses, low; sheep, medium.

References - 1, 2, 3, 6, 9, 11, 13, 21, 22, 40.
1. *Punica granatum* L. - Pomegranate

3. Tropical and sub-tropical.

4. A small tree, 20 feet high or more, spreading, rounded top.

5. Tap and lateral roots penetrating to a depth of 3 feet or more. Fairly windfirm.

6. a. Moderately drought-resistant.
   c. Moderate resistance to alkali.
   d. Ranges from sea level to 4000 feet above sea level.
   e. Temperature range 32 degrees to 130 degrees F.
   f. Not known.

7. Not known.

8. Fruit matures in the fall, abundant crops, fertility high. Easy to collect by hand, germination somewhat delayed. Readily adapted to nursery production. Suckers freely and layers. May be grown from cuttings.

9. Useful as a soil binder in gully heads.

10. a. Low value.
    b. 

11. High value to wildlife as to food and shelter. The fruit is eaten by many species of birds.

13. Fruit valuable for food.
   a. No palatability information.

References - 1, 2, 40.
1. *Purshia tridentata* DC (Kunzia tridentata (Pursh) Sprong.)  
   **Bitterbrush**

4. A spreading shrub to 10 foot.

5. Shallow-rooted but resists wind.

6. a. Dry sites, well drained, never in wet sites.  
   b. Well drained, sandy, cinderly, gravelly or rocky soils.  
   c. Moderately alkali-resistant, calcareous soils.  
   d. From 1000 feet to 8000 feet above sea level.  
   e. Temperatures range from -30 degrees to 110 degrees F.  
   f. Intolerant. (Never in shade)

7. Resistant to insects and disease.

9. Soil binder on dry sites.

10. a. No value to wood products.  
    b. 

11. Valuable to browsing wildlife and cover for small game.

12. No information.

13. a. Palatability: cattle, high; horses, high; sheep, high.

References - 1, 2, 4, 14, 22.
1. *Rhus microphylla* - Littleleaf sumac

2. United States and Mexico. Western Texas to southern Arizona, south into Mexico.

3. Desert foothills, associated with creosote bush, mesquite, and catclaws.

4. A small, to large, spreading shrub.

5. Windfirm.

6. a. Dry sites, drought-resistant.
   b. Indifferent, mainly sandy loams.
   c. Resistant to alkali, calcareous soils.
   d. From 1000 to 5000 feet elevation above sea level.
   e. From 0 degrees to 130 degrees F.
   f. Intolerant?

7. Moderately resistant to insects and disease.

8. Moderately abundant seed production, easily gathered by hand. Fair germination if seed is stratified three months or planted in winter.

9. Soil binder on dry sites.

10. a. No value to wood.
    b. 

11. Valuable as food and good shelter for wildlife.

12. 1-0 rooted stock for spring planting. Easily handled.

13. a. Palatability: cattle, low; horses, low; sheep, low.

References - 4, 22.
1. **Rhus trilobata** Nutt - Lemonade Sumac - Squaw Bush

2. United States, Canada, and Mexico. Ranges from Alberta to Missouri, northern Mexico, and southern Oregon.

4. A shrub from 2 to 10 feet tall with a rounded appearance and growing in crowded stands.

5. Tap and lateral roots spread about 10 feet and penetrate to 5 feet.

6. a. Extremely drought-resistant.
   b. Light sandy or rocky loams.
   d. Ranges from 1000 to 8000 feet above sea level.
   e. Temperature extremes -35 degrees to 120 degrees F.
   f. Tolerant.

7. Fairly resistant to insects and disease.

8. Fruit ripens in the late summer; the crops are poor to excellent depending on season. The seed is not easily collected. Delayed germination. Stratify or plant in winter. 1-0 stock suitable for field planting.

9. A good erosion-control plant as a soil and sand binder.

10. No value for wood.

11. Affords food and good shelter for wildlife. Fruit important to many species of wildlife.

12. 2-0 planting stock for spring planting. 1-0 is largely used.

13. a. Palatability: cattle, low; horses, low; sheep, low.

References - 1, 2, 4, 14, 22, 40.
1. **Robinia neo-mexicana** A. Gray.  
   **Robinia neo-mexicana var. Luxurians Dick.**  
   New Mexico Locust  
   Southwestern Locust

2. United States. Colorado, New Mexico, Arizona, southern Utah.

4. A small shrub or tree attaining 20 to 25 feet, with an open, irregular head.

5. Widely-spread roots, windfirm and water resistant.

   b. Best on deep, rich soils, but will grow on dry, sandy soils.  
   c. Resistant to moderate amounts of alkali. pH 6.5 to 8.0.  
   d. Found from 4000 feet to 9000 feet above sea level.  
   e. Temperature extremes -25 degrees to 120 degrees F.  
   f. Very tolerant.

7. Resistant to insects and disease.

8. Fruit matures in August to September, moderate crops, good fertility. Germination prompt when seed is treated with sulfuric acid or other methods. Easy to propagate in the nursery.

9. On mountain slopes this species sprouts freely, has abundant horizontal roots and forms dense thickets effective in erosion control.

10. a. Wood valued locally for posts and fuel.  
    b. Wood heavy, hard, strong, close-grained, yellow streaked with brown.

11. A good browse plant, furnishes some food and excellent cover for other wildlife. Seeds eaten by Gambel quail.

12. 1-0 rooted stock for spring planting. Easily handled. Sprouts somewhat but not luxuriantly.

13. a. Palatability: cattle, medium; sheep, medium; rabbits, high.

References - 1, 2, 4, 13, 14, 22, 40.
1. *Robinia pseudoacacia* L.  
      **Black locust**  
      **Shipmast locust**  

4. A tree, 70 to 80 feet high, with small, brittle, usually erect branches forming a narrow, oblong head. Short-lived.  

5. Roots spreading and penetrating to a depth of 5 to 10 feet. Windfirm. Sometimes not windfirm on heavy soils; shallow rooting.  

6. a. Moderately drought-resistant, prefers ample soil moisture, but not wet or poorly drained soils. Water table within 10 feet.  
   b. Not exacting as to fertility but prefers limestone soils, brown loams, well drained. Does poorly, or finally dies, on shallow soils or those having hard-pan close to the surface.  
   c. Best on slightly alkaline, non-acid or moderately acid soils. pH 5.00 or better, preferring pH 6.9 to 7.2. Moderately resistant to salt accumulations.  
   d. Sea level to 5000 feet above sea level.  
   e. Temperature range from -30 degrees to 110 degrees F. Is affected by extreme heat or cold.  
   f. Very intolerant.  

7. Fast growing trees resistant to locust borer, otherwise highly susceptible to damage. Shipmast variety reported less susceptible to borer damage.  

8. Seed production heavy, ripening in September, fertility high. Collection easy because of abundance. Germination is prompt when seed is treated with sulfuric acid or other means. Easy to handle in nursery.  

9. Good erosion-control plant, used as a soil binder and in shelterbelts.  

10. a. Wood valuable for fuel, posts and lumber.  
   b. Wood heavy, exceedingly hard, strong, close-grained, very durable in contact with the ground, brown or rarely light green.  

11. Valuable as a food for quail, mourning dove and certain mammals. Also good cover.  

12. 1-0 stock suitable for field planting in the spring. Spurs by suckers. Do not plant on sandy, very dry, very poor, very acid or poorly drained soils.  

(See Over)
13. Produces excellent honey. Many varieties. Poisonous to livestock. Shipmast locust from root cuttings only, said to be a much better tree. 

c. Palatability: cattle, high; horses, high; sheep, medium; rabbits, high.

References - 1, 2, 3, 5, 9, 11, 13, 15, 16, 21, 22, 28, 29, 40, 41.
1. *Hose fondiori Rydb.* - *Rose* (Rosa woodsii Lindl.)
2. United States and Mexico. South Dakota, Montana, Utah, western Texas, into Mexico.
4. A shrub 2 to 6 feet high.
5. Spreading root system, deep penetrating laterals.
6. a. Prefers an abundance of moisture but will grow on drier sites.
   b. Rich, deep, moist loam with an abundance of humus, also on drier and sandier soils. Usually where sub-irrigation is present.
   c. Not resistant to alkali; neutral or acid soils. Circumneutral soils.
   d. Elevation 6000 to 9500 feet above sea level.
   e. Temperature range -30 degrees to 100 degrees F.
   f. Very tolerant.
7. Moderately resistant to insects and disease.
8. Seed easily collected, moderately abundant, ripening in the late summer. Easily propagated from root cuttings.
9. Valuable in moist sites for soil binder.
10. a. No value
11. Furnishes food and excellent shelter for wildlife.
12. Spring planting of rooted plants or root cuttings.
13. Palatable to livestock.
   a. Palatability: cattle, low; horses, low; sheep, medium.

References - 1, 2, 4, 14, 22.
1. Salix amygdaloides wrightii (Anders) Schneider – Wright willow
   (Salix wrightii Anders.)
   (Salix nigra wrightii Anders.)

2. United States and Mexico. Western Texas and southern New Mexico.

4. A small or large tree with a rather compact, round head.

6. a. Requires an abundance of water.
   c. Withstands considerable salts when water supply is abundant.
   d. From 1000 to 6000 feet above sea level.
   e. Temperature range from -20 degrees to 120 degrees F.
   f. Intolerant.

7. Not highly resistant to insects or disease.

8. Seed produced in abundance, easily collected, high fertility, cuttings most satisfactory for propagation.

9. Valuable as a soil binder where cutting by stream is active.

10. a. Valuable locally for posts and poles.
    b. Light, soft, weak, close-grained, light brown.

11. Provides shelter and food for wildlife.

12. 1-0 rooted stock or rooted cuttings easily handled in spring planting. Cuttings very satisfactory for field planting.

13. a. Palatability: cattle, medium; horses, medium; sheep, medium; rabbits, high.

References – 1, 5, 15, 12.
1. Salix exigua Nutt. - Narrow-leaf willow

3. Along streams and in wet places, associated with other willows, poplars and alders.

4. A shrub 10 to 12 foot tall or a tree rarely 25 foot high, with thin, spreading branches forming a round-topped head. Also a rood-like shrub 4 to 6 foot tall.

5. Roots fibrous and spreading, not highly resistant to under-cutting by water. Spreads prolifically by underground runners.

6. a. Requires an abundance of soil moisture.
   b. Moist alluvial soils, sand bars and stream banks.
   c. Resists alkalies and salines when water is abundant.
   d. Sea level to 10,000 feet above sea level.
   e. Temperature range -40 degrees to 120 degrees F.
   f. Very intolerant to shade.

7. Not very resistant to disease or insects.

8. Abundant seed production. Cuttings are preferred for nursery propagation, as seed is difficult to handle.

9. Suitable as a filler on bars, but not as a front line defense on streams where cutting is active and flood pressure extreme.

10. No value to wood.

11. Affords shelter and some browse to wildlife. Slight importance as browse to mule deer.

12. Best propagated in the field by cuttings planted during the winter or spring. Best planted with planting bar or horizontally in moist places. Rooted cuttings are preferred on drier sites.

13. a. Palatability: cattle, medium; horses, medium; sheep, medium; rabbits, high.

References - 2, 12, 13, 14, 22.
1. *Salix gooddingii* Ball. - Dudley willow  
(*Salix vallicola* Britt.)

2. United States and Mexico. California southward, eastward through central  
and southern Arizona, through southern New Mexico to western Texas.

4. A small tree, 25 to 50 feet high, with a broad, rounded crown.

5. Roots: fibrous and wide-spreading, penetrating the soil to considerable  
depth, forming an efficient soil-binding mat.

6. a. Requires an abundance of moisture throughout the year.
b. Does well on any soil, prefers sandy or gravelly soils containing  
humus. Will grow successfully on heavy, clay soils. Willows have  
a high nitrogen requirement.
c. Withstands considerable salts when water supply is adequate.  
d. From sea level to 5000 feet above sea level.
e. Temperature extremes -10 to 120 degrees F.
f. Intolerant.

7. Not highly resistant to insects or disease.

8. Abundant seed production, easily handled cuttings most satisfactory.

9. Very valuable for bank control where cutting is active.

10. a. Wood valuable locally for posts.
b. Light, soft, weak, light reddish brown.

11. Provides shelter and browse for wildlife. Important as browse for mule  
deer.

12. 1-0 rooted stock or rooted cuttings suitable for field planting. Cut-  
tings most satisfactory.

13. a. Palatability: cattle, medium; horses, medium; sheep, medium.

References - 12, 13, 14, 15.
1. *Salix nigra Marsh.* - Black Willow

2. Canada, United States and Mexico. From southern New Brunswick through southern Quebec and Ontario to the region north of Lake Superior, southward to northern and western North Carolina, through South Carolina and Georgia to eastern and central Alabama, and westward to southeastern North Dakota, eastern South Dakota, Nebraska, Kansas, Oklahoma and central and western Texas.

3. Low, moist, alluvial banks of streams and lakes, associated with poplars, alders, and other willows.

4. A tree, usually 30 to 40 feet high, with several clustered stout stems, and thick-spread, upright branches forming a broad, somewhat irregular open or round-topped head.

5. Roots fibrous and wide-spread and penetrating the soil to considerable depths, forming an efficient soil-binding mat. Highly resistant to the cutting action of water.

6. a. Requires much moisture throughout the year, either from natural precipitation or a high water table.
   b. Does well on any soil, prefers sandy or gravelly soils containing humus. Willows have a high nitrogen requirement, but will grow successfully on heavy clay soils.
   c. Withstands considerable saline salts when water supply is abundant.
   d. From sea level to 6400 feet above sea level.
   e. Temperature extremes -40 degrees to 100 degrees F.
   f. Intolerant to shade.

7. Not highly resistant to insects or disease.

8. Practical nursery propagation is by cuttings 8 to 10 inches long made from past season's growth taken during winter. Cuttings very satisfactory for field planting where moisture conditions are good.

9. Very valuable for bank control where cutting is active.

10. a. Wood valuable locally for fuel and posts.
    b. Light, soft, weak, light reddish brown, with thin, nearly white, sapwood.

12. Most suitable planting stock from cuttings. May be driven or planted by planting bar or other tool. Winter or spring planting.

13. Most valuable as an erosion-control plant where moisture is available and cutting action prevalent.
   a. Palatability: cattle, medium; horses, medium.

References - 1, 2, 3, 9, 12, 13.

(See Over)
Also applies in general, except in range, to the following:

1. Salix laevigata Bobb - Bobb willow
2. Salix bonglandiana touneyi (Britt) C. Schu. - Touney willow
3. Salix lasiandra Benth. - Western black willow
   *Blueberry elder*  
   (*Sambucus glauca* Nutt.)  
   (*Sambucus neomexicana* Woot.)

2. United States. Western Montana, through Idaho, Washington south into California, Nevada, Utah, New Mexico and Arizona. *S. glauca* and *S. neomexicana* sometimes separated, little difference and may be considered as varieties. Also *S. c. volutina* and *S. c. arizonica*.

4. — tree, 30 to 50 feet high, with a tall, straight trunk and stout, spreading branches forming a compact, round-topped head.

5. Taprooted, penetrating to a depth of more than 4 feet, relatively wind-firm.

6. a. Prefers a moist soil but will grow on dry sites.
   b. Sandy or clayey loams.
   c. Moderately alkali-resistant, generally neutral or acid sites.
   d. 2000 to 9000 feet elevation above sea level.
   e. Temperature range from -30 degrees to 100 degrees F.
   f. Tolerant.

7. Not resistant to insects and disease.

8. Fruit matures in the summer and fall, crops heavy, fertility good. Easily collected by hand. Germination is slow. Adaptable to nursery production. Ten to twelve months stratification recommended. Suckers freely.

9. Valuable for soil binding.

10. a. Low value to wood.
    b. Light, soft, weak, coarse-grained, yellow tinged with brown.

11. Valuable as wildlife food and cover. Eaten by Gambel quail.

12. 1-0 rooted stock suitable for field planting in spring. Spreads by suckers.

13. Fruit used for human consumption.
   a. Palatability: cattle, medium; horses, medium; sheep, medium; rabbits, low.

References - 1, 4, 13, 14, 22, 40.
1. *Symphoricarpus orbiculatus* Moench. - Indian currant
   (*Symphoricarpus vulgaris* Richx)

2. North America. New Jersey to Georgia, Kansas, Texas, west to South Dakota.

3. Moist shady sites in mountains and canyons.

4. A shrub to six feet in height. Slender upright branches.

5. Fibrous rooted, windfirm.

6. a. Moist places, not drought-resistant.
   b. Deep, rich soils best, but is not particular if moisture present.
   c. Moderately alkali-resistant.
   d. 1000 feet to 7000 feet elevation.
   e. From -30 degrees to 100 degrees F.
   f. Tolerant.

7. No information.

8. Seed moderately abundant, easily gathered by hand. Propagated by seeds, cuttings or division. Long stratification period varying with species required.

9. As filler in windbreaks or soil binder where moist.

10. No value.

11. High value as food and protection for wildlife.

12. None available.

13. a. Palatability: cattle, low; horses, low; sheep, medium; rabbits, medium.

References - 1, 2, 16, 19, 22.
1. Ulmus americana L. - American elm

2. Canada and United States. Southern Newfoundland west to Lake Superior, southward to Florida, westward into North Dakota, western Nebraska, central Kansas, Oklahoma and Texas.

3. River bottoms, intervals, low, rich hills, and banks of streams, associated with oaks, ashes, sycamores, yellow poplar, etc.

4. A tree, sometimes 100 to 120 feet high, with an inversely conic round-topped head.

5. Deep, extensive root development, windfirm. Penetrates 5 to 10 feet in the soil.

6. a. Requires ample moisture, withstands some drought. Water table within 10 feet.
   b. Moist, rich alluvials, loams, moderately well drained, grows on poor or soils. Not exacting, does poorly on fine textured soils.
   c. Moderately alkali-resistant. pH 6.0 to 8.0, circumneutral soils.
   d. Sea level to 6000 feet above sea level.
   e. From -40 degrees to 120 degrees F.
   f. Tolerant.

7. Moderate resistance to insects and disease. Flat head boror.

8. Seed ripens in April, abundant, easily gathered from ground by hand, high fertility. Germinates promptly and plants are easily handled in the nursery. Also propagated by layers.

9. A soil binder in wet or moist sites.

10. a. Valuable for wood, fuel, lumber, and special carpentry.
    b. Heavy, hard, strong, tough, difficult to split, coarse-grained, light brown.

11. Valuable for wildlife food.

12. 1-0 rooted stock for spring planting. Easily handled.

References - 1, 2, 3, 9, 11, 13, 5, 6, 15, 36, 37, 16, 19, 20, 21, 22.
1. **Ulmus parvifolia** Jacq. - Chinese Elm.

3. Asia.

4. A small tree 45 to 75 feet tall, with a broad, round head.

5. Spreading tap and lateral roots, moderately windfirm.

See *Ulmus pumila* L. for further information.
1. **Ulmus pumila L.** - Chinese Elm
   Dwarf Elm

4. Small spreading tree attaining 45 feet, also shrub-like.

5. Spreading tap and lateral roots. Moderately windfirm.

6. a. Drought-resistant to a marked degree.
   b. Not particular as to soil.
   c. Marked resistance to alkali. pH 6.9 to 7.2 best.
   d. Sea level to 7000 feet above sea level.
   e. Temperature extremes -30 degrees to 125 degrees F.
   f. Intolerant. (Ulmus parvifolia tolerant.)

8. Seed matures from April to June, heavy crops, high fertility. Easily collected by shaking onto canvas. Germination prompt, seeds should be sown in nursery the same season as collected. Easily handled in the nursery.

9. Valuable in windbreaks.

10. a. Valuable for fuel and posts.
    b. No information.

11. Little value to wildlife.

12. 1-0 rooted stock suitable for field planting. Plant in spring. Easily handled.

13. Suffers snow and windbreakage.
   a. Palatability: cattle, high; horses, high; sheep, high; rabbits, high.

References - 1, 2, 11, 19, 20, 40.
1. *Vitis labrusca* L. - Foxgrape

2. New England to Georgia, Tennessee and southern Indiana.

3. Moist woods.

4. A strong growing vine.

5. No information.

   b. Any good soil.
   c. No information.
   d. No information.
   e. No information.
   f. Tolerant.

7. 

8. Heavy crops, easily gathered. Propagation by seed or cuttings.

9. Soil binder in moist places.

10. a. No value.

11. High food and cover value to wildlife. Utilized by both birds and mammals.

12. Rooted cuttings or cuttings suitable for field planting.

13. Fruit.
   a. No palatability information.

### PLANT SPECIES INFORMATION FORM

N.B. Underline suitable word wherever possible.

1. **Plant name**
   - Scientific
   - Common
   - Family

2. **Native country**
   - Native habitat

3. **Class, longevity in years**: Tree, shrub, forb, climber, creeper

4. **Growth habit of top**: Height, spread, erect, spreading, drooping, sprawling, prostrate, plants solitary, crowded in dense stands, colonial (as in aspen), bunch type, stoloning, mat forming, sod forming, rhizome forming, layering, etc.

5. **Growth habit of roots**: Tap, spreading, combination, depth, spread, woody, fibrous, fleshy, abundant, very abundant, sparse. Longevity in years. Remarks

6. **Distribution**: Wide, local, abundant throughout its range, abundant in certain localities, not abundant anywhere. Zone altitude, exposure (north, etc.)

7. **Associates**

8. **Drought resistance**: Extreme, moderate, moisture loving

9. **Soil preference**: Heavy, medium, light; clay, loam, sand, gravel, rocky

10. **Alkali tolerance**: Extreme, moderate, neutral, acid

11. **Habitat**: Stream beds, banks, bottom land, mesas, plains, gentle slopes, steep slopes, others

12. **Degree of aggressiveness**: Very, moderately so, not at all

13. **Dates**: Flowering, seed maturity, planting

14. **Seed production**: Heavy, medium, light. Seed fertility: Good, fair, poor
15. Seed collection: Easy, difficult. Why? 
Method 

16. Seed germination: Prompt, medium, slow, delayed. Time required 
Pre-planting treatment 

17. Vegetative propagation by__: Easy, fairly easy, difficult 

18. Adaptability for nursery production: Good, medium, poor; for seed, cuttings, rooted plants, 

19. Age of rooted stock to use for field planting (designate as 1-0, 2-1 etc.) 

20. Transplanting in nursery: Easy, fairly easy, difficult 

21. Adaptability for field planting: Seed cuttings, rooted stock 

22. Uses (Designate relative importance by number of checks.) Soil binder___ , sand binder____, desilting agent______, timbor___ , 

wild life____, general revegetation____, forage: Palatability C & H______, S, & C______, Other uses: 

23. Value for general or specific use (specify) 

24. Outstanding for any particular purpose? 

25. Relative value:________________ . Is some other plant better for same purpose? 

26. Remarks: 

27. To what locality does this information apply?
